**Capparis gialaiensis** Sy, a new species of Capparaceae from Vietnam is described and illustrated. It is morphologically closest to *C. longistipitata*, but differs in length of thorns, filaments and gynophore, shape of the leaf and shape and size of petals. Color photographs, a table comparing the new species with closely allied species and a key are provided to facilitate species identification.

*Capparis* is the type genus of Capparaceae and contains approximately 600 species (Zhang & Tucker 2008), distributed in tropical and subtropical regions worldwide and some in temperate regions. So far, 35 species, 3 subspecies and 2 varieties have been recorded in Vietnam (Pham 1999, Ban & Dorofeev 2003, Zhang & Tucker 2008). During a recent survey in Gia Lai Province, a peculiar species of *Capparis* was collected. It was growing on the basaltic soils of the small hillocks in open, secondary forest areas of Son Lang Commune. After checking the type specimens and comparison with morphologically similar taxa (Gagnepain 1908, 1943, Jacobs 1960, 1965, Chayamari 1991, Pham 1999, Hu 2007, Zhang & Tucker 2008; see also Appendix), we concluded that the plant in Gia Lai Province represents an undescribed species.

**Capparis gialaiensis** Sy, **sp. nova**

*(Figs. 1–3)*

**Type:** Vietnam, Gia Lai Province, K'Bang district, Son Lang commune, 14°20'44.8"N, 108°34'46.7"E, alt. 810 m a.s.l., 23 May 2013, T.T. Bach et al. VK 5402 (holotype HN; isotype Krieb!). — **Paratypes:** Vietnam, Gia Lai Prov-

inence, K`Bang district, Son Lang commune, 14°20'44.8"N, 108°34'46.7"E, alt. 810 m, 23 May 2013, T.T. Bach et al. Thuong 60 (HNI); Gia Lai Province, K`Bang district, Son Lang commune, 14°21'02.1"N, 108°33'00.9"E, alt. 907 m, 19 November 2013 T.T. Bach et al., Quang 68 (HNI).

ETYMOLOGY: The species is named after the type locality, Gia Lai province in Vietnam.

Scendent shrubs, up to 10 m high. Innervations hairy. Spines 0.5–1 mm long, recurved
Capparis gialaiensis (from the holotype).
- A: Flowering twig.  
- B: Young twig with hairs.  
- C: Branch with spines.  
- D: Leaf.  
- E: Basal part of the leaf with hairs on the mid-vein and secondary veins.  
- F: Bud flower.  
- G: Outer sepals.  
- H: Inner sepals of inner.  
- I: Petals.  
- J: Pistil with gynophore and ovary.  
- K: Ovary.  
- L: Branch with fruit.

downwards. Petiole 1.2–1.5 cm long, hairy; leaf blade elliptic to ovate, 5–5.5 × 3–3.5 cm, abaxially hairy on midvein and secondary veins, adaxially glabrous, young ones yellowish green, dark green when older; midvein abaxially raised, adaxially flat; secondary veins 3–5 on each side of midvein; base round or acute; apex acuminate, ca. 0.5 cm long. Inflorescence corymb, axillary or terminal, 9–11 flowered; peduncles 2–2.5 cm long, hairy; pedicels 1.5–1.6 cm long, hairy. Flower buds globose, ca. 2 mm. Sepals 6–6.5 × 3–3.5 mm long, outside pubescent, inside glabrous; sepals of outer whorl ovate; sepals of inner whorl spatulate. Petals white, oblong, 12–13 × 4–5 mm, hairy on surface and margin. Stamens 21–22; filaments 3.7–4 cm long, glabrous, white; anthers ca. 1 mm long. Gynophore 3–3.5 cm long, glabrous. Ovary ellipsoid, ca. 2 × 1 mm, yellowish green, glabrous. Fruits globose, 3.5–3.8 cm in diam, purple to dark violet when mature, surface glabrous. Seed 1–4 per fruit, 1.5–1.7 × 1.2–1.3 cm, black. Flowering in May–July, fruiting in May–November.

Capparis gialaiensis grew on the basaltic soils of the small hillocks in the open, secondary forest areas of Son Lang Commune in association with Betula alnoides, Dicranopteris splendida, Mimosa pudica, Saccharum spontaneum, Stixis ovata subsp. fasciculata, Melastoma sp. and several ferns, at 810–910 m a.s.l. We observed only 15–20 individuals. It appears that the population could be easily affected by human activities.
Key to Capparis gialaïensis and the morphologically allied species in Vietnam

1. Gynophore 0.6–0.8(–1.2) cm long ....... C. cantoniensis
2. Pedicels 2.5–3.5 cm long; sepals glabrous; petals obovate ........................................ C. lanceolaris
3. Pedicels up to 1.5 cm long; sepals hairy; petals oblong or ovate ........................................ C. longistipitata
4. Thorns 0.5–1 mm long; leaf blade elliptic to ovate; petals oblong, 12–13 mm long; filaments 3.7–4 cm long ........................................ C. gialaïensis

Acknowledgments

We thank the directors and curators of HN, HNU, HNPM, P, VNM for allowing us to study the voucher specimens. Thanks are due to Mrs. Le Kim Chi for drawing the illustration. We are also grateful to all the botanists of the Institute of Ecology and Biological Resource, Vietnam Academy of Science and Technology, for collecting specimens of Capparis from various parts of Vietnam. Funding support received from the collaborative project between Institute of Ecology and Biological Resources (IEBR) and Korea Research Institute of Bioscience and Biotechnology (KRIBB) is also acknowledged.
