Enroth, J. 2004: Two new combinations in *Porotrichum* (Neckeraceae). — *Ann. Bot. Fennici* 41: 77.

The new combinations *Porotrichum variifolioides* (De Sloover) Enroth and *Porotrichum frahmii* (Enroth) Enroth are made in the moss family Neckeraceae.

The generic status of *Porothamnium* M. Fleisch. has been questioned by a few authors (e.g. Sastre-De Jesús 1987). Recently Buck (2003) regarded it as a taxonomic synonym of *Porotrichum* (Brid.) Hampe, and made the combination *Porotrichum stipitatum* (Mitt.) W.R. Buck for a species previously known as *Porothamnium stipitatum* (Mitt.) De Sloover. Although I previously (Enroth 1996; cf. also De Sloover 1983) maintained *Porothamnium* separate from *Porotrichum*, I now agree that there are no consistent or adequate gametophytic or sporophytic characters to support that notion and thus two new combinations in *Porotrichum* are made available. The first one is necessary for my treatment of the Neckeraceae in the project *Mosses and liverworts of Uganda*, and the second can be used in forthcoming treatments of neotropical species of *Porotrichum*.

***Porotrichum frahmii* (Enroth) Enroth, comb. nova**

Porothamnium frahmii Enroth, J. Bryol. 19: 34. 1996.
